

Product Announcement

Highly active and human-cell expressed Stemfactor™ TGF-β1

San Diego, CA, March XX, 2009— Biologically active human recombinant cytokines are essential for expansion and differentiation of human embryonic stem (hES) and induced pluripotent stem (iPS) cells. Stemfactor™ TGF-β1 (Cat. No. 03-0004) from Stemgent is an authentic disulfide-linked dimer and tag-free cytokine produced using an efficient human cell-based technology. Its high purity, high biological activity, and affordable price make Stemfactor™ TGF-β1 desirable for stem cell researchers who are interested in exploration of its pleiotrophic functions as they relate to stimulation, proliferation, and differentiation of hES and iPS cells.
